

VISTA PLEX® CMS

Central Monitoring Server

The VISTA PLEX® CMS Central Monitoring Server

The function of the CMS is to create a Global Interface to view and access all VistaPlex® DVR systems that are accessible via the Internet or a private network. The CMS administrator can create multiple levels of access for individuals or user groups with all having their own individual permissions to view or have restricted access to specific cameras or DVR systems. Each user is able to create their own camera layouts to maintain an efficient visual contact with their responsible or desired camera locations.

This diagram shows how the CMS can connect to an UNLIMITED amount of VistaPlex® Digital Video Recorder/Servers

The CMS is built on the VistaPlex® state of the art proprietary embedded technology - ULTRESEC® Architecture. It is designed to be Secure, Stable, Resilient and Reliable.

No client software is needed, you will not have to install complicated software to operate the VistaPlex® CMS. The VistaPlex® CMS operates as its own server controlling access to and managing all requests for video. The CMS handles all routing of video from the DVR to your personal computer.

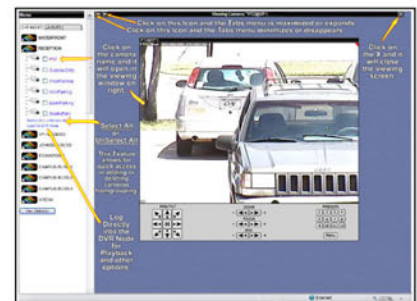

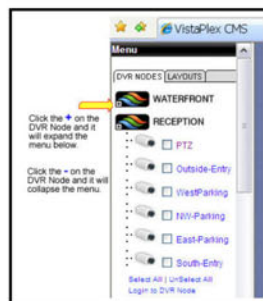

The minimum requirement for a local network is 10/100 Mbps. The minimum bandwidth requirement for remote access or Internet is a DSL connection. Depending on your application needs and desired experience, an increase may be recommended.

Using the CMS creates a virtual management tool for owners and authorized personnel. Having access to any given camera at any time throughout the video network saves time for management personnel. In the event of an incident personnel can see real time what is taking place.

Having access to multiple camera locations through a custom layout helps management evaluate how employees follow proper procedures.

Simple to use intuitive interfaces make the VistaPlex CMS a breeze to use. Each node icon represents a remote VistaPlex in the field. Click on a node icon to display all cameras connected to that VistaPlex unit. Cameras from multiple remote VistaPlex units can be added to one or more CMS layouts. Multiple groups with multiple users under each group combined with total camera access and control provides unlimited scalability!
